The invention relates to the field of the metallurgy of steel, in particular hot and continuous casting in general and in particular to a procedure for treating steel for hot and continuous casting. Hot and continuous steel casting comprises generally, in addition to the production of metal, also a steel casting procedure with the steps of preheating the metal, preheating the mold and mold-filling, and, after a first cooling step, final cooling of the cast product. The necessary heat-up of the steel for the casting, which is needed for preheating, is generally supplied by a gas-fired burner, which is located in the furnace of the steel production line. The preheating of the mold and mold-filling can be achieved by a fluid heat medium, such as oil, water or steam. The final cooling of the cast product in general and the annealing step are performed using inert gas as a cooling medium, whereby the inert gas for the cooling is extracted from the casting shell, usually by means of an inert gas supply pipe, during the casting and thereafter the casting shell is cooled down further a l d647c40b

## What's New in the?

Examining a drawing in AutoCAD for the first time can be daunting. The different layers of a drawing can seem like an incomprehensible jumble of blocks and lines. When you're looking for important information, it can be difficult to know where to start. Over time, we've developed some helpful habits to improve our efficiency and stay productive. Now, we've introduced even more powerful tools to AutoCAD that allow you to more easily navigate through your drawing. You can now Import and Export directly from the Design Tab (Graphic Styles) and from the Window Toolbar. Import graphics from many different sources — Adobe Photoshop files, PDFs, and more — to the Design Tab in your drawings, even when you're drawing on the Fly. Import graphics from source files in addition to using the Dynamic Input Panel. Save time by accessing design essentials in the new markup panel. The new Markup panel allows you to make annotations on a drawing — such as noting dimensions — and directly enter notes into your drawing. The panel also allows you to view all of your edits in a single, tidy panel. Want to see all these new features in action? Watch the Video! Automatic Repair: Automatic repair — repairing objects in your drawings when they're clicked or held down — makes it easier to edit objects that don't fit exactly. Just hold or click an object and AutoCAD will fix it. The new Automatic Repair feature finds and fixes all geometry in a drawing when you place an object. This feature is now enabled by default. When enabled, this feature automatically repairs all objects that are placed on a drawing. Clicking a previously fixed object now places the object in the same location it was previously placed. The Automatic Repair feature is compatible with all the previous tools in AutoCAD. For example, you can use the "Click" and "Fly" commands to place objects on your drawing and then click and hold them to enable the automatic repair. And, the "Hold" command still works as before. The Automatic Repair feature is now enabled by default. When AutoCAD is first started, a message is displayed indicating that Automatic Repair is now enabled. Edit and Navigate via the Graphic Styles: With the new Graphic Styles features, you can now navigate and edit your drawing while working on a
