A: Almost certainly the link you are trying to open is a broken link, likely because of the dns change or an incorrect re-routing of the IP to a new server. Ran into the same issue where an IP link would sometimes start blinking and then the link would go dead. All that meant was my router had somewhere along the way dialed a new IP. Just check the IP address shown on the link you are trying to open and see if that's the new one.

1. Field of the Invention The present invention relates to a panel display device which requires no backlight.

2. Description of the Related Art Conventionally, there is known a head-mounted type display device using an optical modulation element. In addition to the head-mounted type, display devices using liquid crystal panels, plasma display panels (PDP), and the like have been proposed. Since the size of each of the above display devices is too large for a wearable display device, a form, for example, a projection-type display device using a projector has been developed. Although some of the projectors use the liquid crystal panel, the most display devices use a light source formed by light-emitting diodes, laser light sources, etc. In the following description, the light source formed by light-emitting diodes, etc. is referred to as an "optical light source". In the above display device, the total reflection mirror is provided for reflecting the incident light from the optical light source toward the visual line of the observer. In this display device, although the light from the optical light source is reflected by the total reflection mirror and is directed toward the observer, the light emitted from the display device itself is directly incident upon the observer. In this case, the light reflected by the total reflection mirror is totally reflected by the observer's eyeball and the projection-type display device is therefore recognized by the observer as a very bright light. On the other hand, since the total reflection mirror is disposed within the visual field of the observer, the light incident upon the observer's eyeball from the total reflection mirror is partially reflected by the eye and enters the observer's brain. For this reason, this display device has a problem in that it disturbs the observer and is uncomfortable for the observer to wear. In order to solve this problem, Patent Document 1 discloses a head-mounted display device capable of masking the display light from
