Many other advanced image manipulation programs — such as GIMP, Paint Shop Pro, and PhotoShop from Adobe — are built upon Photoshop's foundation. Although Photoshop still rules the roost of photo editing software, the other tools have become excellent tools for creative editing. The only reason that photo-editing specialists use Photoshop is because it's the most well-known. Features When using Photoshop for photo editing, be sure to save your work frequently so you can go back to your editing if you make any changes. Saving often allows the program to remain responsive to your keystrokes, and this is especially useful if you are working in the editing window with many layers and objects open. To save an image, hit Command-S (Mac) or Ctrl-S (Windows). Alternatively, you can right-click on the image and select Save or Save as. Several options for saving are available, however, be sure to use the option that gives the highest-quality output. It will save time if you have already made a mistake in your editing. With most editing software, you can undo your edits and save your images, but with Photoshop it is not possible to undo edits you make with the program. Managing layers and objects Layers Layers are the basic building block of Photoshop. Photoshop has three types of layers: regular layers (non-text layers), mask layers (for clipping and compositing) and selection layers. Non-Text Layers The Photoshop layer palette (choose Window > Layers from the menu) shows all the layers that are open in your image. An image's layers are organized from top to bottom. The mask layers are on the top. The photo shown here has a total of seven layers. The topmost layer is a layer mask for the flash. The next layer down is a layer mask for the main image. The bottom two layers are fill layers; they are used to fill in any areas of the image that are white or clear. To change the order of the layers, double-click on a layer in the order you want it to appear. Double-click again to change the order back. You can't change the order of text layers, only the order of non-text layers. You can add another layer for your edits by double-clicking the top layer. The current editing tools can be found in the color swatches at the top right of the

Q: When is $\lim_{x \rightarrow a} f(x) = f(a)$ and not $\lim_{x \rightarrow a} f(x) = f(b)$ for the given function? Suppose that $f: \mathbb{R}^n \rightarrow \mathbb{R}^m$ is a smooth function, and $\alpha = (a_1, \dots, a_m) \in \mathbb{R}^m$, $\beta = (b_1, \dots, b_m) \in \mathbb{R}^m$, α and β are different. In my book it is written If $\alpha = \beta$, then $\lim_{x \rightarrow a} f(x) = f(a)$ Then what is the difference between writing $\lim_{x \rightarrow a} f(x) = f(a)$ and $\lim_{x \rightarrow a} f(x) = f(b)$ It is given that it is assumed that α and β are different, and I don't see why $\alpha = \beta$ implies $\lim_{x \rightarrow a} f(x) = f(a)$ A: It means that you are looking at f at x and f at y and then comparing it with the limit. In the first case, you use the fact that f is continuous, so you are looking at two f , compare them with your limits. In the second case, you are comparing one f with the limit, so you need continuity of the whole f at your pair of points. The Music of Silence Nyctophobia, the fear of the dark and darkness, is the reason why night music is so curious. Most of the time, night music is experienced in the silence of the night, whether that means in a huge concert hall, in a club, in a private residence or in a forest; silence is certainly the essence of the emotion at stake. The main thing is to know how to listen to night music. Night music is music played at night and night. The word

Q: Firebase database structure for a queued list of tasks Firebase documentation says that while using `limitToLast()` function of the Realtime Database, if I have a list of tasks (say three) I can use the following structure Task data --> {task1: {task2: {}, task3: {}}, task4: {}} However, I want to do this for a list of tasks, say three and more. If I do so, then what will be the result? {task1, task2, task3, task4, task5, task6, task7} --> {task1: {}, task2: {}, task3: {}, task4: {}, task5: {}, task6: {}, task7: {}} OR {task1, task2, task3, task4, task5, task6, task7} --> {task1: {}, task2: {}, task3: {}, task4: {}, task5: {}, task6: {}, task7: {}} I believe the first one is better but how can I figure out that? A: Assuming that all tasks are numbered you can use: { tasks:[{task1: null}, {task2: null}, {task3: null}] } If there are not numbered then do something like this: { tasks:[{task1: null}, {task2: null}, {task3: null}] last:0 } So that all you need to do is get the last index in the list to determine which task is last. firebase - root The Justice Department released an indictment Friday against members of a gang that allegedly tied up, robbed and in some cases killed hapless victims and posted photos of their brutal slayings on social media.
