A: I guess you were looking for this module to send text messages. A function can only output something. You don't put output in the function! It's just output from the function. The get_user_agent function returns a string. You have to put it somewhere, like a function parameter: user_agent = get_user_agent() user_agent = "Mozilla" If you put this in a function, the caller can use it. A function call returns None. If you put the None somewhere, then the caller can use it. Let me give you some examples: def do_something(user_agent): # `user\_agent` is a parameter here return "foo" def some_other_function(): # What is `user\_agent`? user_agent = get_user_agent() if user_agent == "Mozilla": return "bar" else: return "baz" You always need to output something. You put it inside a function, the callers can use it. While you just return a string: you can output it at the caller end with functions like print, or by returning it. Returning the None explicitly isn't needed in your examples, because the return is implicit. E.g. user_agent = get_user_agent() c6a93da74d
